Score Devices

If

Create an issue

OUTPUT

device : Router-R1 (10.10.1.1)

health_score : 10/100

issue : Critical device failure: BGP sessions down, interfaces down, and high resource utilization.

cause : Likely hardware failure or critical firmware crash leading to interface and process shutdown.

action : Immediately perform a hardware diagnostic check, verify power/cabling, and initiate a device reboot followed by a configuration audit.

state : Stable

device : Router-R2 (10.10.1.2)

health_score : 100/100

issue : No issue detected. The device is operating optimally.

cause : None. All metrics are within normal operational parameters.

action : Continue routine monitoring. No immediate action required.

state : Critical

device : Router-R3 (10.10.1.3)

health_score : 40/100

issue : BGP session is DOWN and CPU utilization is critically high.

cause : BGP session failure combined with high CPU usage suggests a potential control plane overload or neighbor configuration mismatch.

action : Investigate BGP configuration, check routing peer logs, and identify processes consuming high CPU.

state : Critical

device : Router-R4 (10.10.1.4)

health_score : Critical (Severity: High)

issue : Interface DOWN, high CPU/Memory, and significant packet loss.

cause : Interface failure combined with severe resource exhaustion (CPU 90%, Memory 88%) leading to packet loss.

action : Verify physical connections, perform interface reset, and investigate high resource utilization (CPU/Memory) causing potential process instability.

state : Healthy

device : Router-R5 (10.10.1.5)

health_score : 100/100

issue : None - system operating normally.

cause : None; all metrics are within normal operational parameters.

action : Continue routine monitoring. No immediate action required.
